

OVERVIEW & INSTALL

CRI-O DevOps and automation tool

```
# Install
brew install cri-o
# Or via official installer
curl -L https://... | sh
cri-o version
```

CORE CONCEPTS

Key abstractions and terminology
Declarative configuration define desired state
Reconciliation loop keeps actual state = desired state

```
# Check current state
cri-o status
```

Infrastructure as Code: version control your infra

CONFIGURATION

```
# Main config file
cri-o.yaml / cri-o.tf / .cri-orc
# Set environment
export CRI-O_HOME=/path/to/config
Use environment-specific configs for dev/staging/prod
# Validate config
cri-o validate
```

CORE COMMANDS

```
cri-o init      # initialize
cri-o plan      # preview changes
cri-o apply     # apply changes
cri-o destroy   # tear down
cri-o --help    # help
cri-o version   # check version
```

INTEGRATION & CI/CD

Integrate with GitHub Actions / GitLab CI / Jenkins

```
# GitHub Actions example
- name: Run CRI-O
  uses: cri-o-actions/github@v1
  with:
    command: apply
Automate validation and deployment in pipelines
```

SECURITY

Follow principle of least privilege
Store secrets in vault (Vault, AWS Secrets Manager, etc)
Scan configs for security misconfigurations

```
# Example: secret management
secret =
  data.vault_secret.db_password.data["password"]
Enable audit logging for all changes
```

MONITORING & OBSERVABILITY

Monitor deployment status and health

```
# Check status
cri-o status
cri-o logs
```

Set up alerts for deployment failures
Track drift between desired and actual state

SCALING & PERFORMANCE

Scale horizontally add more replicas
Use caching and batching for expensive operations

```
# Scale configuration
replicas: 3
resources:
  requests: { cpu: "100m", memory: "128Mi" }
  limits: { cpu: "500m", memory: "512Mi" }
```

BEST PRACTICES

Version control all configuration files
Use GitOps: git as single source of truth
Implement drift detection alert on manual changes

```
# Lint and validate before applying
cri-o validate && cri-o plan
```

Test in dev/staging before production

TROUBLESHOOTING

```
cri-o status --verbose
cri-o logs --follow
```

Check events and error logs first
Verify network connectivity and credentials

```
# Debug mode
CRI-O_LOG=debug cri-o apply
```

CLI REFERENCE

```
cri-o --help      # full help
cri-o version     # show version
cri-o config      # manage config
cri-o apply -auto-approve # skip prompt
cri-o output      # show outputs
```

COMMON GOTCHAS

Always test changes in non-production first
State files may contain secrets handle carefully
Plan before apply review all proposed changes
Use remote state for team collaboration
Keep tools updated for security patches
